**DECLARATION OF INVENTORS UNDER 37 CFR 1.131**

Commissioner of Patents  
Washington, D.C. 20231  
Sir:

1. I hereby declare that I am an inventor in the above-identified U.S. patent application, which is a continuation of U.S. Patent Application No. 09/173,854, filed on October 16, 1998.

2. At the time of the invention described and claimed in the identified U.S. patent application, I was working for CNGroup, which became Veo Systems. Veo Systems was in turn acquired by Commerce One.

3. Prior to March 11, 1998, we had implemented a registry for trading partners. The registry was used in a method, also implemented prior to March 11, 1998, in a form sufficient to demonstrate that the method would work for its intended purpose, for establishing transactions among trading partners in a network, comprising: maintaining a registry of machine-readable

16/30

**Application No. 09/633,365**

specifications specifying business services offered by trading partners, the machine-readable specifications including at least one of definitions of, and references to definitions of, services offered and at least one of definitions of, and references to definitions of, documents to be exchanged with such services by trading partners; and providing, in response to a request, one or more of the machine-readable specifications from said registry is via a communication network to a requesting node.

4. Attached hereto as Exhibit A is an excerpt of a memorandum, which I am informed, or know from personal knowledge, was written by co-inventor Glushko, prior to March 11, 1998. Exhibit A includes the statement, "In particular, the eCo server has now subsumed the registry and query services that had been envisioned as part of the Taxonomy of Everything in our proposal." This comment establishes that the registry and supporting services had been implemented at the time the memorandum was written.

5. The implementation of the method described above occurred within the United States prior to March 11, 1998.

6. Work on the system including the registry continued without interruption from at least as early as March 11, 1998, through the filing date of the parent U.S. patent application No. 09/173,854 on October 16, 1998.

7. I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Title 18, United States Code, §1001 and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

**COMMERCE ONE (company that acquired VEO SYSTEMS, formerly CNgroun)****Technical Milestones, Progress and Impact**

CNgroun is the technical and administrative focal point for the JV. Its primary R&D responsibilities are the design and development of the Common Business Language and the eCo run-time platform. CNgroun has made substantial progress in both during the first quarter.

CBL (Common Business Language) enables semantic interoperation and integration of different commerce applications. CBL defines the metadata for making a business and its services a self-describing "eCo component"; it enables the intelligent query and aggregation of product catalogs and descriptions; it represents the forms and messages needed for commercial transactions; and it can be used to "wrap" formats and messages to make legacy applications "eCo-compliant". Specific technical activities performed during the first quarter as part of CBL R&D included:

1. Development of a "design philosophy" for overall scope and approach of CBL
2. Analysis of existing standards for common information types and semantic primitives. Where appropriate, semantics have been drawn from the UN/EDIFACT Basic Semantic Unit data dictionary and certain ISO and IETF standards (e.g., for geographical location, date and time, currency, weights and measures).
3. Analysis of proposed metadata frameworks for Internet resources (Dublin Core, RDF, MCF).
4. Analysis of semantics of commerce as embodied in EDI X12 transaction sets, Uniform Commercial Code, and in proposals like the Open Buying on the Internet specification.
5. Creation of first draft of CBL to support the requirements of Project Seitai (described above in "Project Baseline").
6. Determining an approach for CBL support of industry applications (and for ATP demonstrations in particular).

The development of CBL has strongly shaped the requirements for the eCo runtime platform. XML is now at the core of the eCo architecture, and the eCo server can be thought of as an XML processing platform on which CBL is the reference application. The use of XML inside the eCo platform as well as in its applications has enabled the server to be more capable and extensible than we conceived at the time of the proposal.

In particular, the eCo server has now subsumed the registry and query services that had been envisioned as part of the Taxonomy of Everything in our proposal. The TOE was proposed as a scalable, distributed registry service for implementing Internet-based directory and translation services, and a key architectural building block and core task in the Phase 1 plan.

During the second quarter CNgroun will continue the design and development of CBL and the eCo server. Specific activities include:

1. Work on "transaction choreography" to represent higher-level workflow and process information in CBL
2. Further analysis and possible integration with OBI, OTP specifications
3. Work on the packaging and routing of CBL in communications between eCo servers.
4. Development of domain-specific CBL (originally called CTDs in the proposal) when a demonstration project is identified
5. Specification and implementation of APIs for supporting joint demonstrations with Tesseract and BusinessBots

The registry was used in a method, also implemented prior to March 11, 1998, in a form sufficient to demonstrate that the method would work for its intended purpose, for establishing transactions among trading partners in a network, comprising: maintaining a registry of machine-readable

20/36

**Application No. 09/633,365**

specifications specifying business services offered by trading partners, the machine-readable specifications including at least one of definitions of, and references to definitions of, services offered and at least one of definitions of, and references to definitions of, documents to be exchanged with such services by trading partners; and providing, in response to a request, one or more of the machine-readable specifications from said registry is via a communication network to a requesting node.

4. Attached hereto as Exhibit A is an excerpt of a memorandum, which I am informed, or know from personal knowledge, was written by co-inventor Glushko, prior to March 11, 1998. Exhibit A includes the statement, "In particular, the eCo server has now subsumed the registry and query services that had been envisioned as part of the Taxonomy of Everything in our proposal." This comment establishes that the registry and supporting services had been implemented at the time the memorandum was written.

5. The implementation of the method described above occurred within the United States prior to March 11, 1998.

6. Work on the system including the registry continued without interruption from at least as early as March 11, 1998, through the filing date of the parent U.S. patent application No. 09/173,854 on October 16, 1998.

7. Co-inventors Meltzer, Allen, Fuchs, Glushko and Maloney jointly made such invention prior to March 11, 1998.

8. I am informed and believe that Commerce One has been unable to find co-inventor Allen. I am informed and believe that all of the co-inventors Meltzer, Fuchs, Glushko and Maloney were asked if they knew how to reach Mr. Allen, and all replied that they do not know how. A last known address of co-inventor Allen was obtained from Commerce One employee records, and is P.O. Box 123, Occidental, California 95465. An attempt to reach Mr. Allen by Express Mail to that address failed, and the package was returned to the attorney for Commerce One marked "refused," as seen on the attached copy (Exhibit B) of the mailing label for such package.

9. I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are

Sir:

1. I hereby declare that I am an inventor in the above-identified U.S. patent application, which is a continuation of U.S. Patent Application No. 09/173,854, filed on October 16, 1998.
2. At the time of the invention described and claimed in the identified U.S. patent application, I was working for CNGroup, which became Veo Systems. Veo Systems was in turn acquired by Commerce One.
3. Prior to March 11, 1998, we had implemented a registry for trading partners. The registry was used in a method, also implemented prior to March 11, 1998, in a form sufficient to demonstrate that the method would work for its intended purpose, for establishing transactions among trading partners in a network, comprising: maintaining a registry of machine-readable

25/30

**Application No. 09/633,365**

specifications specifying business services offered by trading partners, the machine-readable specifications including at least one of definitions of, and references to definitions of, services offered and at least one of definitions of, and references to definitions of, documents to be exchanged with such services by trading partners; and providing, in response to a request, one or more of the machine-readable specifications from said registry is via a communication network to a requesting node.

4. Attached hereto as Exhibit A is an excerpt of a memorandum, which I am informed, or know from personal knowledge, was written by co-inventor Glushko, prior to March 11, 1998. Exhibit A includes the statement, "In particular, the eCo server has now subsumed the registry and query services that had been envisioned as part of the Taxonomy of Everything in our proposal." This comment establishes that the registry and supporting services had been implemented at the time the memorandum was written.

5. The implementation of the method described above occurred within the United States prior to March 11, 1998.

6. Work on the system including the registry continued without interruption from at least as early as March 11, 1998, through the filing date of the parent U.S. patent application No. 09/173,854 on October 16, 1998.

7. I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Title 18, United States Code, §1001 and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

**COMMERCE ONE (company that acquired VEO SYSTEMS, formerly CNgroun)****Technical Milestones, Progress and Impact**

CNgroun is the technical and administrative focal point for the JV. Its primary R&D responsibilities are the design and development of the Common Business Language and the eCo run-time platform. CNgroun has made substantial progress in both during the first quarter.

CBL (Common Business Language) enables semantic interoperation and integration of different commerce applications. CBL defines the metadata for making a business and its services a self-describing "eCo component"; it enables the intelligent query and aggregation of product catalogs and descriptions; it represents the forms and messages needed for commercial transactions; and it can be used to "wrap" formats and messages to make legacy applications "eCo-compliant". Specific technical activities performed during the first quarter as part of CBL R&D included:

1. Development of a "design philosophy" for overall scope and approach of CBL
2. Analysis of existing standards for common information types and semantic primitives. Where appropriate, semantics have been drawn from the UN/EDIFACT Basic Semantic Unit data dictionary and certain ISO and IETF standards (e.g., for geographical location, date and time, currency, weights and measures).
3. Analysis of proposed metadata frameworks for Internet resources (Dublin Core, RDF, MCF).
4. Analysis of semantics of commerce as embodied in EDI X12 transaction sets, Uniform Commercial Code, and in proposals like the Open Buying on the Internet specification.
5. Creation of first draft of CBL to support the requirements of Project Seitai (described above in "Project Baseline").
6. Determining an approach for CBL support of industry applications (and for ATP demonstrations in particular).

The development of CBL has strongly shaped the requirements for the eCo runtime platform. XML is now at the core of the eCo architecture, and the eCo server can be thought of as an XML processing platform on which CBL is the reference application. The use of XML inside the eCo platform as well as in its applications has enabled the server to be more capable and extensible than we conceived at the time of the proposal.

In particular, the eCo server has now subsumed the registry and query services that had been envisioned as part of the Taxonomy of Everything in our proposal. The TOE was proposed as a scalable, distributed registry service for implementing Internet-based directory and translation services, and a key architectural building block and core task in the Phase 1 plan.

During the second quarter CNgroun will continue the design and development of CBL and the eCo server. Specific activities include:

1. Work on "transaction choreography" to represent higher-level workflow and process information in CBL
2. Further analysis and possible integration with OBI, OTP specifications
3. Work on the packaging and routing of CBL in communications between eCo servers.
4. Development of domain-specific CBL (originally called CTDs in the proposal) when a demonstration project is identified
5. Specification and implementation of APIs for supporting joint demonstrations with Tesseract and BusinessBots
